TOLEDO FLOOR RESURFACING, INC.

TFR MEMBRANE

USES:

TFR Membrane is an elastomeric seamless hi-solids, two component waterproof membrane. Its use is the initial layer in a multi-layer system designed for waterproofing of the substrate.

The membrane maintains its bond and elasticity in temperatures of -40 to 200° F. Its elastomeric characteristics provide excellent flexibility to accommodate expansion and contraction, structural movement and impacts, which could crack or puncture conventional coatings.

PRODUCT DESCRIPTION:

The membrane is an elastomeric urethane that is not a permanent wear coat. It is a protective coating to be used only in conjunction with overlayment and coating.

The Polyurethane Membrane is a two component, liquid applied waterproofing that forms a seamless, flexible membrane when applied to horizontal surfaces.
